Received 13 December 2007; accepted 18 January 2008

Key indicators: single-crystal X-ray study;  $T = 193\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.017\text{ \AA}$ ;  $R$  factor = 0.055;  $wR$  factor = 0.114; data-to-parameter ratio = 18.0.

In the crystal structure of the title complex,  $[\text{Pt}(\text{C}_5\text{H}_4\text{NOS})_2]$ , the Pt atom is coordinated by two O atoms and two S atoms in a *cis* configuration, forming a distorted square-planar coordination geometry. The molecule exhibits pseudo- $C_{2v}$  symmetry and is essentially planar, with a maximum deviation from planarity of  $0.0124(2)\text{ \AA}$ . The dihedral angle between the two pyridine rings is  $5.85(2)^\circ$ .

### Experimental

#### Crystal data

$[\text{Pt}(\text{C}_5\text{H}_4\text{NOS})_2]$	$V = 1167.87(10)\text{ \AA}^3$
$M_r = 447.39$	$Z = 4$
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation
$a = 6.9832(3)\text{ \AA}$	$\mu = 12.36\text{ mm}^{-1}$
$b = 22.3897(11)\text{ \AA}$	$T = 193(2)\text{ K}$
$c = 8.1495(4)\text{ \AA}$	$0.27 \times 0.22 \times 0.08\text{ mm}$
$\beta = 113.572(3)^\circ$	

#### Data collection

Bruker Kappa APEXII diffractometer	25638 measured reflections
Absorption correction: multi-scan ( <i>SADABS</i> ; Blessing, 1995, 1997)	2778 independent reflections
$T_{\min} = 0.051$ , $T_{\max} = 0.372$	2610 reflections with $I > 2\sigma(I)$
	$R_{\text{int}} = 0.068$
	$R_{\min} = 0.051$ , $T_{\max} = 0.372$

#### Refinement

$R[F^2 > 2\sigma(F^2)] = 0.054$	154 parameters
$wR(F^2) = 0.114$	H-atom parameters constrained
$S = 1.32$	$\Delta\rho_{\max} = 1.73\text{ e \AA}^{-3}$
2778 reflections	$\Delta\rho_{\min} = -3.87\text{ e \AA}^{-3}$

### **cis-Bis(2-sulfidopyridine N-oxide)platinum(II)**

**B. Ravindran Durai Nayagam, S. R. Jebas and D. Schollmeyer**

#### **Comment**

N-oxides and their derivatives show a broad spectrum of biological activity, such as antifungal, antibacterial, antimicrobial and antibiotic activities (Lobana & Bhatia, 1989; Symons *et al.*, 1985). These compounds are also found to be involved in DNA strand scission under physiological conditions (Katsuyuki *et al.*, 1991; Bovin *et al.*; 1992). Pyridine N-oxides bearing a sulfur group at the 2-position display significant antimicrobial activity (Leonard *et al.*, 1955). The crystal structure of the title compound in the *trans* configuration has already been reported (Zhou *et al.*, 2005). The crystal structures of *cis*-bis(2-mercaptopypyridine N-oxide)palladium and *cis*-bis(2-mercaptopypyridine N-oxide)nickel have already been reported (Shi *et al.*, 1997; Chen *et al.*, 1991).

In the title compound, the Pt is coordinated by two O atoms and two S atoms from two mercaptopypyridine N-oxide ligands in a *cis* configuration. The coordination geometry is distorted square-planar. The whole molecule exhibits pseudo-C<sub>2v</sub> symmetry, with a pseudo-C<sub>2</sub> axis passing through the platinum atom. The average Pt—O and Pt—S distances of 2.048 (7) and 2.236 (3) Å of the title compound are comparable with the values reported in the literature (Dyksterhouse *et al.*, 2000). The mean Pt—S bond length (2.236 (3) Å) is shorter while the mean Pt—O bond length (2.048 (7) Å) is longer than those reported for the *trans* isomer (Pt—S 2.270 Å; Pt—O 2.007 Å) (Zhou *et al.*, 2005). The C—S bond distances [1.725 (11) and 1.730 (11) Å] are slightly longer than those reported for the uncoordinated thione molecule [1.692 (2)—1.698 (2) Å; Ohms *et al.*, 1982]. The mean C—S bond length (1.727 Å) shows partial double bond character; it is shorter than the normal covalent bond distance of 1.81 (2) Å, for a C—S single bond (Lydon *et al.*, 1982). This further results in the fact that complexes with mercaptopypyridine oxide (mpo) ligands have little ability to bridge another metal ion through a sulfur atom to form polynuclear complexes (Shi *et al.*, 1997). The entire molecule is essentially planar, with a maximum deviation from planarity of 0.0124 (2) Å for atom C3. The dihedral angle between the two pyridine rings is 5.85 (2)°.

#### **Experimental**

By heating a mixture of dichlorido(ethane1,2-diamine)platinum(II), Pt(en)Cl<sub>2</sub> (0.326 g, 1 mmol) and 1-hydroxypyridine-2-thione sodium salt (0.298 g, 2 mmol) in 20 ml of water at 338 K with magnetic stirring for 1 h, a red-orange compound was obtained. This was filtered and dried (0.32 g, 80% yield). The compound was dissolved in methanol and allowed to undergo slow evaporation. Fine red crystals were obtained after a week.

#### **Refinement**

H atoms were placed in calculated positions [C—H = 0.95 Å] and refined in the riding model approximation;  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . The highest residual electron density peak is 1.724 Å from C13 and the deepest hole lies 1.688 Å from N1.

2778 independent reflections	$l = -10 \rightarrow 10$
2610 reflections with $I > 2\sigma(I)$	

### Refinement

Refinement on $F^2$	H-atom parameters constrained
Least-squares matrix: full	$w = 1/[\sigma^2(F_o^2) + (0.0153P)^2 + 17.8973P]$
	where $P = (F_o^2 + 2F_c^2)/3$
$R[F^2 > 2\sigma(F^2)] = 0.054$	$(\Delta/\sigma)_{\text{max}} = 0.001$
$wR(F^2) = 0.114$	$\Delta\rho_{\text{max}} = 1.73 \text{ e \AA}^{-3}$
$S = 1.32$	$\Delta\rho_{\text{min}} = -3.86 \text{ e \AA}^{-3}$
2778 reflections	Extinction correction: none
154 parameters	

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
